

## S-Drive and the Signature Wave (Basic Explanation)

The S-Drive is a breakthrough technology, which allows a user to interface epigenetic information from a sample of hair with the root attached.

The sample of hair and root carry the person's unique signature wave virtue of the relationship that the hair has with the embryological development of the person and their brain and nervous tissue. As the hair, the skin and the brain are of ectodermic origin they are regarded as sensory organs. As they are sensory organs they can pick up environmental signals via a wide range of frequencies that allow for physiological responses to occur within the human body.

The signature wave is a particular characteristic of each individual, as exclusive as a finger print. So, it identifies the individual as such and carries epigenetic information that in the case of the S-Drive can be digitised and decoded in an informational facility in Hamburg, Germany.

Everything in the universe is constantly resonating and vibrating and in doing so, frequencies are emitted. These frequencies communicate with one another via Bio-photons. They share information via the emission of weak current and light known as Bio-photons. The information is shared among living system through epigenetics.

The current scientific understanding is that bio-photons carry cellular interactive information to facilitate the levels of complexity that allow atoms to become molecules, and molecules to eventually become an integrative system called a cell that allow for the formation of an organism which is capable of sustaining life as we know it. The process of building up and breaking down cells we know as metabolism and it is an energy based system that uses the most efficient energy transfer to facilitate the metabolic processes. There are factors which can reduce this efficiency and lead to the use of more energy than the body can sustain. When the body gets into this energy deficit it cannot sustain the metabolic processes in a normal manner and you start to notice the symptoms of this. If this situation persists then it can eventually lead to chronic illness.

The signature wave carries information about epigenetic lifestyle indicators that most commonly affect the metabolic energy processes. These indicators are assessed using a powerful computerised bio-resonance system at our Hamburg facility. Resonance is the process of finding coherence between the person's signature wave and a series of system generated waves of the key indicators. The higher the coherence value the higher the level of significance. The data is used to create the charts and tables that are used to create a client report.

At the atomic level, epigenetic influence reflects the homeodynamic state of the bio-photonic emissions of the body. This is a chaotic system which is non-linear and ever changing but that gives rise to the complexity and organisation of the entire organism. It can be confusing to compare reports conducted in the short-term as the stability that the body shows at a physical level is the response to millions of epigenetic influences overtime. To negate this 'quantum' effect, it is best to give the body 90 days between tests. Tests can effectively be conducted at 90/180/270 and 360 day intervals, which correlate to the natural organising rhythms of the body.

For more information and in-depth science about the S-drive and signature wave please read the article '**Quantum Mechanics, the Wave Equation, S-Drive and Signature Wave**' by Dr Carlos Orozco.

In this article all of the details discussed above are proven mathematically and scientifically by one of the leading lights Quantum mechanics and its relationship with our daily wellness.
